Curation Memo: Prototype A

To: Professor John Drake
From: Team 4 (Bara Abusamhan, Ehsanullah Pardisi, Kyle Robertson and Leonard Mann)
Client: Quick Phone Repair
Date: October 24, 2026
Subject: Selection of Prototype A for the Quick Phone repair system

---

We shared three interface prototypes with the owner of Quick Phone Repair and selected Prototype A, the desktop Workspace design. This memo defends that choice on his feedback, user fit, accessibility and personal taste.

Sponsor feedback

The owner chose A because it fits how both stores work today. B was built for tablets the stores do not use, and C's dark, dense board was harder to read.

We then updated A with his answers. Check-in requires name, phone, device model and the reported issue, and the passcode is optional and seen only by the assigned technician. Technicians can take open jobs, declined jobs carry no diagnostic fee, and Managers set reorder points.

User fit

Both stores run only on Lenovo ThinkPad laptops, so A's desktop layout fits the hardware staff already use. Each role gets its own screen, phone search prevents duplicate customers, and booking blocks full time slots.

Accessibility

A meets the standard we set from B: a visible label on every field, controls at least 44 pixels tall, statuses written in words, and dark text on a light background. C's dark theme was harder to read in a bright shop.

Personal taste

The owner preferred A's familiar business layout, and our team found it the easiest for new staff to learn. From B we kept its accessibility features but dropped the tablet layout and step-by-step wizard. From C we kept the job history but dropped the dark theme and dense home screen.

Conclusion

Prototype A is the design we carry into Sprint 4. Payment methods and ticket printers remain open questions for the owner.
